Class 10

Brian Wells (PID: A69026838)

```
string <- c("10", "100", 1, "1,000")
as.numeric(string)+1
```

```
Warning: NAs introduced by coercion
```

```
[1]  11 101   2  NA
```

Q. Write a function to fix this non numeric table

```
x <- string
as.numeric(gsub(",","", x))
```

```
[1]   10  100    1 1000
```

```
data.file <- "Data Export Summary.csv"
stats <- read.csv(data.file, row.names=1)
head(stats)
```

           0.04            0.02          100.00 
```

Q2: What proportion of structures in the PDB are protein?

```
sum(statsn[1:3,7])/sum(statsn[,7])
```

```
[1] 0.9784556
```

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

I found 211,377 examples.

#pdb format

> Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

That is because the hydrogen is hidden, you can only see the oxygen. This is because the resolution is 2 angstrom, Hydrogen is only 1 A.

> Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

Yes, HOH308

> Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document. Discussion Topic: Can you think of a way in which indinavir, or even larger ligands and substrates, could enter the binding site?

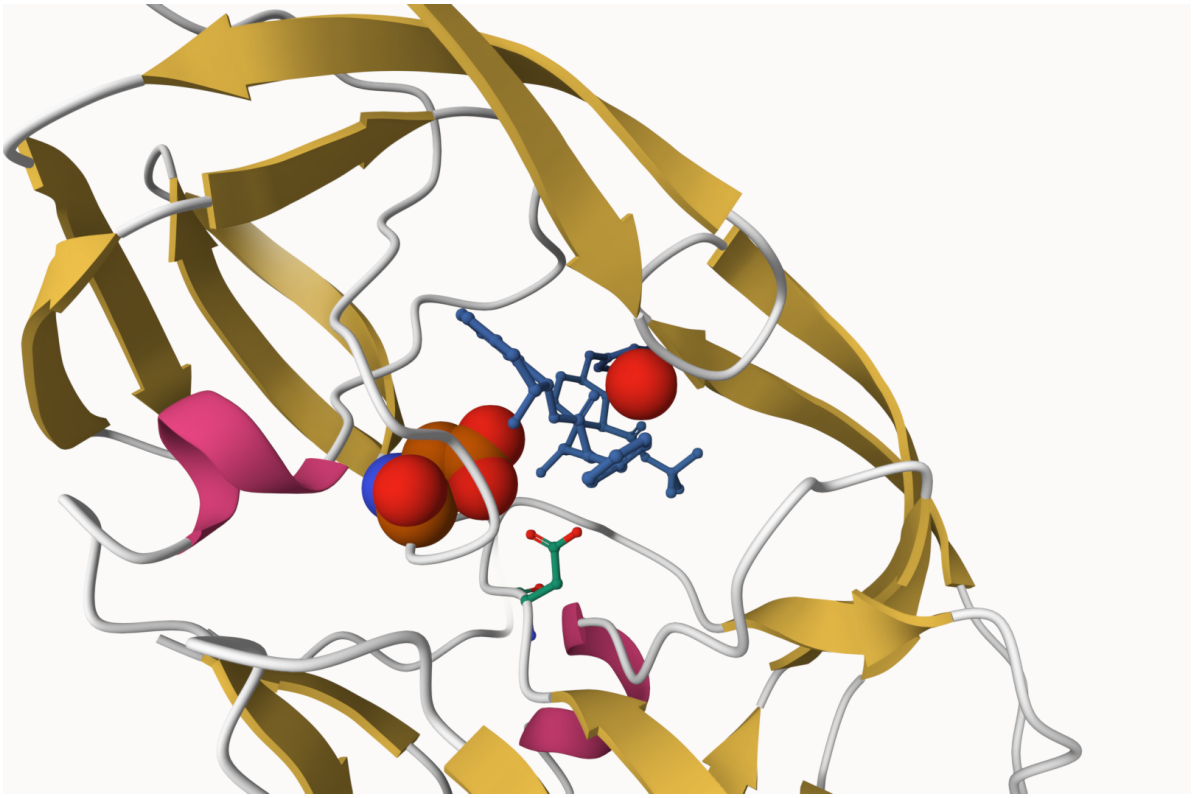

Figure 1: A lovely image

#3. Introduction to Bio3D in R

```
library(bio3d)
pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

   Total Models#: 1
